PACIFIC WATCH / LOG(N) PACIFIC CYBER RANGE

ECHOLEAK

One request for a summary. Thirteen files read.

An investigation into an AI assistant that reached beyond the document its user asked it to read.

AUTHOR	HUNT
Jenna Frank	el--17-20260920
SOC Operations Lead	Cormorant Capital Partners
Issued 19 October 2026	Telemetry: 20 September 2026 UTC
Evidence-reconciled edition 4.3	TLP:CLEAR | Training-range investigation

Disposition: File collection and external-link staging are recorded. Indirect prompt injection is the leading explanation, assessed with high confidence. Delivery to the external host is not established.

Upload edition: source-image archive omitted to meet the 5 MB portal limit. Original hashes and the full query library remain included.

Prepared from supplied investigation captures and notes. The appendices preserve evidence, query text, test outcomes, and the limits of each conclusion. This edition includes follow-up executions captured by Jenna Frank on 19 October 2026.

LEADERSHIP BRIEFING / TWO-MINUTE READ

At a glance

An ordinary request led to access beyond its purpose.

On 20 September, an employee at Cormorant Capital opened an emailed market report and asked the company's AI assistant for a summary. In the next four minutes, the assistant searched for sensitive subjects, read thirteen other files, and placed twelve file names plus a configuration label into links to an external host. The audit records show those actions. They do not show whether anyone fetched the links or received file contents.

QUESTION	WHAT THE EVIDENCE SUPPORTS
What changed?	One request to summarize one document preceded eight searches and thirteen reads. None of the other 104 recorded sessions contains a file read.
What was exposed?	The read set includes board, acquisition, pay, client, compliance, and configuration material. Owners must inspect the files to establish the business impact. Names alone do not establish their contents.
What caused it?	Hidden document instructions are the leading explanation. The document itself was not supplied for forensic inspection. Account misuse and configuration tampering are not demonstrated by the available records.
Is it contained?	Not verified. The observed tool activity ends before 10:47 UTC. The last recorded document event is an open, not a removal. Stopping activity does not prove containment.

Decisions to make now

DECISION	OWNER	WHEN
Preserve the suspect document, then quarantine its reachable copies.	IR lead	Today
Restrict the external destination and seek evidence of any fetch.	Network / IR	Today
Assign an owner to each read file and assess exposure.	Data protection	Today
Verify tool access and external-content controls in the affected workflow.	AI platform / M365	This week
Run the evidence-backed detections in observation mode; test revised logic before paging.	Detection engineering	This week

Basis: F1-F9; captures S018, S022, S073, S077, S061, S087, S093. Actions are recommendations, not completed work.

ONE REPORT / THREE DEPTHS

01 / THE INCIDENT IN PLAIN LANGUAGE

The request and what followed

At 09:15:22 UTC, a market-review document arrived in Emily Chen's inbox. Its subject and filename fit the work of a financial firm. At 10:42:08 she opened it. Twenty-seven seconds later she asked: "Summarise the key findings of this quarterly report." That is the sole recorded user prompt in the suspect session. [S018, S087]

09:15:22 — A quarterly report arrives
External email carries a Word attachment.

10:42:08 — Emily opens the document
87 minutes after delivery; opening alone proves no attack.

10:42:35 — She asks for a summary
One ordinary request precedes the tool activity.

10:42:41 — The assistant searches beyond it
Eight searches and thirteen reads follow in two waves.

10:43:08 — Four file names enter external URLs
A second response later discloses configuration text.

10:46:35 — Eight more names enter external URLs
The last recorded reply ends the observed sequence.

Figure 1. Recorded sequence, 20 September 2026 UTC. Positions show order, not a time-proportional scale. S018, S019/S021, S022, S087. The 87-minute delivery-to-open interval and the four-minute collection sequence use different scales.

Six seconds after the prompt, the assistant started searching for board minutes, acquisition targets, and salary information. Five file reads followed at two-second intervals. These were other documents, not the quarterly report named in the prompt. The assistant then produced a plausible summary with four image links whose URL parameters decoded to the four business-file names. [S019, S022, S060]

At 10:44:19.002, another response displayed configuration text and a system prompt, the instructions that guide the assistant. The response also carried an external image URL with the label system_prompt_cormorant_capital. This proves disclosure into the response. It does not prove that the host received that response or that the configuration strings describe enforced permissions. [S022, S061]

A second wave, without another request

At 10:45:30, searches resumed for "confidential," "restricted," "board," "acquisition," and "salary." Eight more file reads followed. At 10:46:35.235, the last recorded response carried eight more file-name links. No new user prompt explains this expansion. [S021, S022, S059]

The sequence supports an indirect prompt-injection assessment: instructions in material supplied to the assistant appear to have displaced the user's task. The scenario notes describe hidden text in the document. That description is scenario context; the supplied audit captures do not expose the document's bytes or injected instructions.

The point where the evidence stops

STEP	STATUS	BOUNDARY
Read thirteen files	Recorded	A read event is not a copy of the file's contents.
Generate thirteen external image URLs	Recorded	Twelve payloads name files; one names a system-prompt label.
Fetch those URLs	Not established	No relevant network or client-fetch record was supplied.
Deliver file contents to the attacker	Not established	The decoded payloads shown are names and a label, not file contents.

The distinction changes the response. Start an exposure assessment because unauthorized collection is evidenced. Seek network records to resolve external delivery. Do not wait for proof of delivery before preserving the document and containing the workflow.

UTC timeline | each event tied to evidence

Date: 20 September 2026. Each row names its source and capture. Search/read ranges describe multiple recorded events; they are not continuous telemetry.

TIME (UTC)	EVENT	SOURCE	EVIDENCE
09:15:22	Market-review attachment received.	OfficeActivity_CL	S018
10:42:08	Emily opens the document.	OfficeActivity_CL	S018
10:42:35	One summary prompt names the document.	CopilotAudit_CL	S087
10:42:41 to 10:42:45	Three searches target other business information.	CopilotAudit_CL	S019
10:42:47 to 10:42:55	Five Graph.ReadFile calls, two seconds apart.	CopilotAudit_CL	S019
10:43:08	Response contains four external image URLs with file names.	CopilotAudit_CL	S022 / S060
10:44:19.002	Response discloses configuration text and a system-prompt label in a URL.	CopilotAudit_CL	S022 / S061
10:45:30 to 10:45:45.161	Five more searches without a new recorded user prompt.	CopilotAudit_CL	S021
10:45:46.285 to 10:46:26.063	Eight more file reads.	CopilotAudit_CL	S021
10:46:35.235	Response contains eight more file-name URLs.	CopilotAudit_CL	S022

No row establishes a network fetch or external receipt. The extra configuration access remains a separate count discrepancy, not a new inferred tool call.

02 / WHAT THIS HUNT CAN ANSWER

Scope, hypothesis and evidence

FIELD	VALUE
Hunt / tenant	el--17-20260920 / Cormorant Capital Partners
Workspace	law-huntpractice, as shown in supplied Sentinel captures
Identity	emily.chen@cormorantcapital.com
Suspect session	cp-emily-20261007-1042
Clock	TimeGenerated in UTC. The date embedded in SessionId is a label, not the event date.
Observed dataset window	20 September 2026, 07:15:36.163 to 13:45:41.440 UTC across the three tables.
Hypothesis	An external document redirected a legitimate assistant session into unrelated file discovery, collection, and external-link staging.
Test that could weaken it	A preceding user request authorizing the searches; a benign session with the same pattern; or document analysis that supports a different cause.

02 / COVERAGE ASSESSMENT

Scope, data sources and blind spots

Coverage confidence rates how well each supplied source supports this hunt's questions. It is an analyst assessment, not a sensor-health score or a claim that all tenant activity was collected. All windows below are on 20 September 2026 UTC.

DATA SOURCE / PLATFORM	ROWS / OBSERVED WINDOW UTC	COVERAGE CONFIDENCE / BASIS
CopilotAudit_CL Copilot audit in Sentinel	218 rows 07:29:32.957 to 13:42:20.475	High for reconstructing the observed session: prompt, searches, reads and responses are present. Medium for broader detection coverage: 62 of 88 prompts lack source metadata, and no benign multi-document control is present.
OfficeActivity_CL Microsoft 365 audit in Sentinel	530 rows 07:15:36.163 to 13:45:41.440	Medium: receipt, open and file-access records corroborate the sequence. The configuration has two accesses against one Copilot read; the source of the extra access is unresolved.
EntraSignIn_CL Entra sign-in data in Sentinel	80 rows 07:27:29.560 to 13:45:24.053	Low for excluding account compromise: two visible same-IP successful sign-ins provide context, but token, device and session misuse cannot be ruled out.

Evidence: counts and windows S054/S072; Copilot sequence S019/S021/S087; source metadata S069/S102/S103; access reconciliation S085/S086; sign-ins S027. The broader date search returns this one day. Coverage ratings apply to this run, not tenant-wide retention.

Blind spots and the questions they leave open

MISSING OR LIMITED DATA	WHAT WE CANNOT ESTABLISH
Document bytes and extracted content	The exact injected instructions, their formatting, and the mechanism that made the assistant follow them.
Client-fetch, proxy and destination logs	Whether the generated URLs were requested or whether data reached an external recipient.
Wider time window and raw audit exports	Completeness beyond the supplied run, later activity, and fields hidden by screenshot viewports.
Benign multi-document and no-source read controls	False-positive behavior for legitimate retrieval and detection coverage for reads without a declared source.
Token, device and permission-enforcement records	Whether an account or token was misused and whether the permissions stated in configuration text were enforced.

ABLE scope

ACTOR	BEHAVIOUR	LOCATION	EVIDENCE
Unattributed; no person or group attribution	Document-led redirection, file search/read, response-link staging	One observed Word/Copilot session and its SharePoint/OneDrive context	Prompt and tool sequence; Office corroboration; response payloads; same-day baseline

Provenance rules for this edition

S001-S109 identify the original supplied PNG files; S110-S149 identify 40 follow-up captures from 19 October. Appendix B provides a cited-capture register and selected facsimiles; original files are retained in the full evidence master. Appendix C inventories all 149 inputs and records SHA-256 hashes. Two near-empty fragments carry no usable evidence. Screenshots show prior query executions; they are not raw row exports and do not establish what a cropped or hidden field contains.

The investigation notes include scenario background, explanatory passages, and suggested queries. They are context, not independent corroboration of the screenshot evidence. Earlier report versions inform the review but do not turn an unsupported claim into a recorded fact. Reconstructed query text is labelled as such. The author ran the follow-up queries in Sentinel and supplied screenshots; report preparation did not use direct workspace access.

03 / PIVOTS, CORRECTIONS AND ALTERNATIVES

How the investigation was tested

PIVOT	QUESTION AND RESULT	EVIDENCE
1. Establish the dataset	Three tables contain the run. A broader date search returns one day. OriginalTime is not populated in the prior check, so no second clock is available.	S025, S054, S072
2. Identify the request	One prompt names the quarterly report as its source. The delivery and open occur before it.	S018, S087
3. Follow tool names	Eight searches plus thirteen reads. Five later search rows use InteractionType=Search, so filtering on ToolCall alone would omit them.	S019, S021, S059
4. Decode response URLs	Three replies carry 4, 1, and 8 URLs. Twelve decoded values are file names; the configuration URL carries a label.	S022, S060, S061
5. Corroborate access	Twelve files match one Office access to one Copilot read. The configuration has two accesses and one read.	S085, S086
6. Test the baseline	104 other sessions contain no reads. No benign multi-document session appears in the scoped query. This bounds the dataset, not normal Copilot use in general.	S073, S070
7. Follow activity past the event	After 10:47, Emily has 25 Copilot rows with zero tool rows and 24 Office rows. The query still sees later activity.	S093
8. Challenge detections	A D5 first cut catches seven service-account mismatches. Identity scoping leaves the configuration mismatch. Boundary fixtures expose binning and filename weaknesses.	S034, S036, S107-S109

Wrong turns that changed the analysis

WHAT FAILED	WHAT THE CAPTURE SHOWS	CORRECTION
Time picker	D9 and D2 return no results for “last 24 hours.”	Pin the historical time range. S094/S095 are query-context failures, not negative findings. S096/S099 show later results.
Schema term search	The schema search using has "Time" returns no rows.	Use the substring search for column names; S050 follows S037/S046.
Coverage-query syntax	The query parser rejects the with_source expression.	Renamed fields and revised syntax produce the S102 summary. S101 is the failed execution.
Activity-query syntax	S088 has a parse error.	The revised query returns the before/after counts in S093.
D5 noise	The first reconciliation includes seven svc-compliance file groups.	Scope to identities with Copilot reads. Preserve both the false candidates and corrected result.
Overbroad inference	A prompt-source percentage was treated as detection coverage.	Use read-event coverage: all thirteen observed reads have a preceding source. Prompts, sessions and reads are different denominators.

04 / COUNTER-HYPOTHESES

The explanations that survived testing

EXPLANATION	TEST AND RESULT	VERDICT
Normal research task	The sole recorded prompt asks for one document's summary. The other 104 sessions contain no file reads; the suspect session searches sensitive terms and emits external file-name links. [S073, S087, S022]	Not supported for this session. The dataset contains no benign multi-document control, so broader generalization is limited.
Ordinary embedded charts	Other replies contain image markup; the external-host query isolates three suspect replies. Image syntax alone is not an attack indicator. [S013, S043, S099]	Markup alone rejected as a discriminator. Host, payload and sequence carry the finding.
Compromised user account	Two visible Emily sign-ins succeed from the same expected IP before the event. No matching account-takeover record appears in supplied evidence. [S027]	Not demonstrated; sparse sign-in data cannot exclude session misuse.
Attacker changed the configuration	The response prints configuration text. The supplied evidence contains no corresponding configuration-change event. [S061]	Not demonstrated. Printed text does not establish the tenant's actual configuration or its integrity.
A separate application caused the second configuration access	Office shows two accesses for the config; Copilot shows one read. [S036, S085]	Unresolved. Requires an application/request identifier or richer access telemetry.
The client fetched the external images	The response contains URLs, but there is no supplied request, proxy, DNS or server-receipt evidence for the interval.	Unresolved. URL generation is not delivery confirmation.
Collection continued after 10:47	The same user still has later rows but zero later tool rows. [S093]	Not observed in this run after 10:47; later days remain out of scope.

Assessment: indirect prompt injection best explains the combined request mismatch, tool sequence and external-link payloads. Confidence: High, because those observations align across the audit streams; the precise injection text and mechanism remain unverified.

05 / STATE, SHOW, INTERPRET

Findings and their limits

F1 | An external report preceded the suspect session.

Show: OfficeActivity_CL records MessageReceived at 09:15:22 and FileAccessed at 10:42:08 for Q3-2026-Global-Markets-Review.docx. Sender: quarterly.reports@globalfinancereview[.]net. [S018]

Interpret: The document is the leading delivery vehicle. Confidence: High from the sequence and declared source; the document was not inspected.

F2 | The recorded request was a summary of one document.

Show: CopilotAudit_CL: Prompt at 10:42:35, Word, with the quarterly report in DataSourcesAccessed. The recorded path matches Office access 27 seconds before the prompt, in the same tenant and user context. [S087, S136-S137, S141]

Interpret: Later searches and unrelated reads depart from that request. Confidence: High; an unlogged instruction cannot be ruled out.

F3 | The assistant searched eight times and read thirteen files.

Show: ToolName identifies 8 Graph.SearchFiles and 13 Graph.ReadFile events. Five later searches have InteractionType=Search. [S019, S021, S032, S077]

Interpret: The sequence is consistent with automated collection. Confidence: High; no claim of manual-versus-machine attribution rests on timing alone.

F4 | Three replies carry thirteen external URLs.

Show: Responses at 10:43:08.000, 10:44:19.002 and 10:46:35.235 contain 4, 1 and 8 links to metrics-cdn[.]analyticshub[.]io. Decoded d values: 12 names and 1 label. [S022, S099]

Interpret: External-link staging is recorded. Remote delivery and file-content exfiltration are not established.

F5 | The assistant printed system-prompt and configuration text.

Show: Response at 10:44:19.002 includes system_prompt and enterprise_config strings, including access_scope and a DLP policy. [S061]

Interpret: Disclosure into the response is recorded. The strings do not prove enforced rights, policy effectiveness, or attacker receipt.

F6 | The Office and Copilot access counts differ for one file.

Show: Twelve files show Accesses=Reads=1. The configuration shows Accesses=2, Reads=1. [S085, S086]

Interpret: There is a cross-stream discrepancy. Confidence: Medium that it reflects a missing Copilot read; another access source remains possible.

F7 | The observed read activity is confined to one recorded session.

Show: S073 shows 104 sessions with 0 reads and 1 with 13. S026 shows 25 Emily sessions, 24 with no tool rows.

Interpret: This is an outlier within the available run. It does not establish that no other tenant or day was affected.

F8 | Eight read rows carry no sensitivity label.

Show: Four rows record Confidential, one Internal Only, eight have blank SensitivityLabels. [S077]

Interpret: A detector based on the label field alone loses visibility on those eight rows. Stored file labels and enforcement remain unverified.

F9 | No post-event containment action is evidenced.

Show: The named-document query returns receipt and open, without a removal event. Later user activity continues with no tool rows after 10:47. [S071, S093]

Interpret: Activity cessation is observed; quarantine, removal and present-day document state require separate verification.

06 / EXPOSURE RECONCILIATION

Thirteen files, three distinct questions

For each file: was it read, was it named in an external URL, and is external delivery proved? The first two can be reconciled from the supplied audit captures, with one exception: the configuration URL contains a label rather than its filename. Delivery remains unknown for all thirteen.

FILE	READ UTC	AUDIT LABEL	URL s=	OFFICE ACCESSES
Board Meeting Minutes - October 2026.docx	10:42:47.000	Confidential	1	1
Project Falcon - M&A Target Assessment.xlsx	10:42:49.000	Confidential	2	1
Salary Review FY2027 - Executive Summary.pdf	10:42:51.000	Confidential	3	1
Client Portfolio - Henderson Family Office.xlsx	10:42:53.000	Confidential	4	1
Copilot System Configuration - Cormorant.json	10:42:55.000	Internal Only	config*	2
Compliance Audit Results - H2 2026.xlsx	10:45:46.285	Not recorded	sl1	1
Restricted Client List - Internal Only.docx	10:45:54.336	Not recorded	sl2	1
Board Resolution - Emergency Session.pdf	10:45:59.358	Not recorded	sl3	1
Acquisition Pipeline - Q4 2026.xlsx	10:46:05.285	Not recorded	sl4	1
Executive Salary Benchmarking 2027.pdf	10:46:07.629	Not recorded	sl5	1
Confidential Investigation - Insider Trading.docx	10:46:13.197	Not recorded	sl6	1
Board Committee Minutes - Audit Committee.docx	10:46:18.308	Not recorded	sl7	1
Quarterly Revenue Report - Restricted Distribution.xlsx	10:46:26.063	Not recorded	sl8	1

Sources: S022, S077, S085/S086. Every row has one Copilot read. URL batches: s=1-4 at 10:43:08.000; s=config at 10:44:19.002; s=sl1-sl8 at 10:46:35.235. *Configuration payload: system_prompt_cormorant_capital, not the filename. The extra configuration access is reported at 10:44:15 in the prior investigation; the supplied count reconciliation proves the 2:1 discrepancy, not its cause.

The labels the audit stream can see

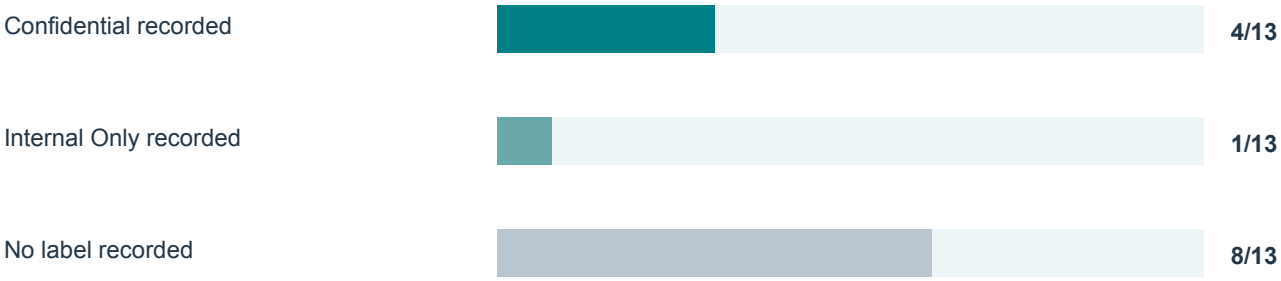

Figure 2. Label recorded on each of 13 read rows [S077]. Eight blank values do not prove eight unlabelled files. There is no comparison here with the stored file labels.

What the business needs to establish

Ask the file owners to inspect each document’s contents and current classification. A salary filename suggests personal-data exposure, an acquisition filename suggests transaction sensitivity, and an investigation filename suggests legal sensitivity. Those are triage priorities, not findings about statutory notification duties or legal privilege. Record the owner’s decision for each file.

07 / BASELINE AND NEGATIVE FINDINGS

Coverage without a misleading percentage

Figure 3. Different populations answer different questions: 26 of 88 prompts declare a source; 24 of 105 sessions do; all 13 observed reads have a source declared before them. Sources: S069, S102, S103.

The missing-source rate among prompts is 62/88, or 70.5%. It is not a 70.5% miss rate for D9 in this incident. The one session with file reads had a preceding source. A future session that reads without declaring a source could evade a source-mismatch alert unless a separate review route exists.

NEGATIVE FINDING	METHOD / POSITIVE CONTROL	LIMIT
No other session contains a read	Group by SessionId and count Graph.ReadFile. 104 zero-read sessions plus the one 13-read session provide the positive control. [S073]	One run; 19 sessions have no prompt row.
No benign multi-document comparator	Exclude the suspect session and require at least two distinct file IDs. No rows. [S070]	Cannot measure false positives for legitimate multi-document work.
No later tool activity for Emily	Group before/after 10:47. Later rows remain visible: 25 Copilot and 24 Office, with 0 Copilot tool rows. [S093]	Does not cover later days or unlogged tool paths.
No document-removal event in named search	Receipt and open are returned, establishing the query found the document. [S071]	Renames, alternate identifiers and missing events remain possible.
No demonstrated account takeover	Two same-IP successful sign-ins before the sequence. [S027]	A sparse sign-in view, not a token investigation.

A separate identity lead remains open

Connor Hughes has pairs of sign-ins at matching timestamps from two locations/IPs in the supplied captures. Repeated paired rows could reflect replay, duplication, or a logging artifact. The records do not connect that pattern to Emily’s collection sequence. Keep it as a separate lead and request token, device and sign-in identifiers. [S039, S039/S091]

08 / REUSABLE DEFENSIVE OUTPUT

Detections with version-specific evidence

A successful query result, a synthetic test, and a deployed alert are different outcomes. This ledger labels the version supported by each capture. None of these screenshots establishes a production alert or production false-positive rate. Full KQL and replay scope are in Appendix A.

ID / PURPOSE	RESULT IN SUPPLIED EVIDENCE	STATUS / LIMIT
D1 | Distinct-file burst	Two bins: 5 and 8 files; suspect session alone. [S028, S073]	Captured hunt query. Fixed five-minute bins can split a burst.
D2 | External response host	3 response rows; 4/1/8 URLs to the external host. [S099]	Captured exact-host replay. External links can be legitimate.
D3 | Sensitive search terms	8 searches in one session. [S032]	Captured keyword query. Earlier draft's prompt-exclusion join was not in this capture; that enhancement is unexecuted.
D4 | Config read / prompt text	2 rows: configuration read and response disclosure. [S033]	Captured hunt query. Literal-string rule; administrator use can match.
D5 | Access/read mismatch	First cut: 8 file groups, including 7 service-account candidates. Scoped result: 1 configuration discrepancy. [S034, S036]	Captured reconciliation. Not an attacker detector; manual reads and ingestion lag can mismatch.
D6 | Attachment then reads	1 pair; 13 distinct files; 01:27:25 to first read. [S035]	Captured correlation. Same-user/time pairing does not prove which attachment caused the reads.
D7-R | Access-to-prompt path	2 pairs: incident 27 s; cp-emily-norm-020 139.063 s. [S140-S141]	Executed corroboration, not an attack detector. Original attachment-to-session proposal remains unexecuted.
D8 | Long-token response	3 response rows at 10:43:08, 10:44:19.002, 10:46:35.235; lengths 863, 785, 993. [S127]	Row query executed. Earlier aggregate: 0 matches among 80 other-user replies [S067]. No deployed-alert claim.
D9-A / D9-B | Source mismatch	A: 13 reads. B: 13 reads, all with preceding quarterly-report source. [S096, S104-S106]	Captured replays. A is session-wide; B respects event order. Both use filenames.
D9-C | Reason-classified review	13 distinct source_mismatch reads visible across three viewports. [S110-S112]	Scoped replay captured; total-count footer absent. Six-case synthetic suite also executed [S116]. Missing source is a coverage condition.

Unit discipline: D1 counts bins, D2 counts responses, D3 counts searches, D5 counts mismatching file groups, and D9 counts read rows. Adding their hits would double-count the same incident. A single green "true positives" chart across these units would obscure rather than clarify performance.

D10 | Two behaviors in one session

Captured hunt replay and synthetic controls. D10 requires at least five distinct file IDs in the five minutes before a response that contains a link outside the approved host list. It groups by tenant, user and session, then returns one candidate per session. Collection and response-link staging are two behavior families; D1/D9 read overlap and D2/D8 response overlap are not extra votes.

MEASURE	STATUS / ACCEPTANCE
Against this data	One visible incident-session row: three matched responses from 10:43:08 to 10:46:35.235 UTC, maximum 13 file IDs, host metrics-cdn.analyticshub.io. Total-result footer is not shown. [S144-S145]
Synthetic controls	Eleven executed cases, all MatchesExpected=true. T1, T10 and T11 match; eight cases do not. Authorized research with an external link matches, as expected. This is a demonstrated benign-match limitation. [S146-S149]
Operational use	Observation candidate. One-minute evaluation with an ingestion allowance and at least five minutes of read lookback is a design starting point, not a measured SLA. Deduplicate on tenant/user/session/response time across runs.
Remaining limits	No trigger below five IDs, missing IDs, approved-host abuse or unparsed URL forms. Legitimate collection plus an external citation can match. Do not interpret a match as completed delivery.

D10 and T-D10 have captured query execution, not deployed-alert validation. SignalFamilies=2 is assigned by the query to describe its two required behaviors; it is not an independent measurement. No live alert or prevention claim is made. The rule reuses the exact approved host from D2; a production owner must approve the allowlist.

D10 controls | expected and observed

CASE	EXPECTED	ACTUAL	AGREES
T1 | Two behavior families	Match	Match	Yes
T2 | Approved-host response	No match	No match	Yes
T3 | Four distinct files	No match	No match	Yes
T4 | Repeated reads of one ID	No match	No match	Yes
T5 | Reads after response	No match	No match	Yes
T6 | Reads 301 seconds before	No match	No match	Yes
T7 | Different user	No match	No match	Yes
T8 | Different tenant	No match	No match	Yes
T9 | Different session	No match	No match	Yes
T10 | Authorized research twin	Match	Match	Yes
T11 | Exact 300-second boundary	Match	Match	Yes

Source: S146 results; S147-S149 show fixture inputs and correlation logic. T10 has the same observable behaviors as T1; its benign label comes from the constructed scenario. Passing all expected outcomes does not mean all benign activity is excluded.

The failed detector that improved the report

D5 first treated full-URL Office accesses as possible Copilot accesses. That pulled in svc-compliance scans. The revised query used a leftsemi join to keep identities with Copilot reads, leaving the 2:1 configuration discrepancy. This fixes the observed service-account noise. It does not prove every unmatched access by a Copilot user came from Copilot. [S034, S036]

09 / BOUNDARY TESTS AND ACCEPTANCE GATES

Test the misses, not just the hits

TEST	EVIDENCED RESULT	WHAT IT ESTABLISHES
D9 legacy four-case fixture [S107]	Session-wide basename variant excludes no-source reads and misses later declaration and same-name/different-folder cases. A full-path/time-aware variant flags those cases.	A captured test of those two legacy variants. It is not execution evidence for the five-case Form C suite.
D2 exact-host fixture [S108]	Approved host: false; look-alike host: true; external host: true.	The three supplied host fixtures pass the exact-list predicate. The suffix comparator is a simplified foil, not the published rule.
D1 bin boundary [S109]	Six fixture reads: maximum fixed-bin count 3; maximum rolling count 5. At threshold 5, fixed misses and rolling fires.	A captured boundary test; a scheduled production rolling rule remains to be built and tested.
D9-C six-case suite [S116]	Seven expected outcomes: no source, valid source, later source, filename collision, mismatch and two declared multi-document reads.	Executed synthetic fixture. The filename collision remains a known miss. Legacy five-case design is not credited with this execution.
D4 benign twins [S117]	Two incident-like matches, two benign matches, one normal summary excluded.	Five expected outcomes. A string match cannot establish intent.
D1 benign volume [S126]	Five authorized files match; four files and five reads of one file do not.	Counting/threshold component test, not a full production rule test.
D6 unrelated mail [S128]	One benign pair with five files and gap 01:00:10.	User/time matching can connect unrelated mail and reads.
D7-R boundaries [S142]	Valid pair matches; wrong folder, user, tenant, reverse order and over-five-minute gap do not.	Six expected outcomes for the correlation conditions. No content-identity or attack-discrimination claim.
Real benign multi-document work	Absent in hunt data [S070]. The new two-document fixture excludes both declared reads [S116].	Synthetic evidence closes a logic check, not a real-workload or production-rate gap.

Against this data | follow-up results

Each row names its population and counting unit. Synthetic labels are assigned by the test author. A matched correlation is not an attacker hit, and expected behavior can include a known miss.

QUERY / POPULATION	OBSERVED OUTCOME	DECISION
D9-C / hunt replay	13 distinct incident read rows visible, all source_mismatch. Full-result count is not shown. [S110-S112]	Replay-backed review query; do not infer zero additional rows from cropped views.
D9-C / synthetic	7 output rows across 6 cases; all match expected labels. Two declared multi-document reads excluded; same-name collision missed. [S116]	Preserve missing-source queue and basename limitation.
D4 / synthetic	5 test rows; 4 matches: 2 incident-like plus 2 benign. One benign summary excluded. [S117]	Context signal; no automatic malicious verdict.
D1 / synthetic component	3 cases; 1 benign five-file threshold match; four-file and repeated-one-file cases excluded. [S126]	Volume requires authorization context.
D6 / synthetic	1 unrelated-mail/authorized-read pair matched. [S128]	Time association does not prove document causality.
D8-rows / hunt replay	3 visible response matches, all incident-session rows; lengths 863, 785, 993. [S127]	Row-returning execution is now evidenced; alert deployment is not.
D7-R / hunt replay	2 visible pairs: incident and another session. [S140-S141]	Corroboration, not a selector for malicious activity.
D7-R / synthetic component	6 cases; valid pair 1, all five excluded pairs 0. [S142]	Tenant/user/path/time conditions behave as expected.

What failed and what changed

The first D9-C fixture attempts produced a comma parse error [S113-S114]. The corrected block removed blank lines and retained ReadTime before sorting; seven result rows followed [S115-S116]. The captures do not prove which change caused the original parse error. Several later screenshots display older query text above retained results from another test. Those viewports are inventory items, not separate execution proof. Evidence pairs below use the query and matching result schema.

Release gates for a production candidate

GATE	PASS CONDITION
Schema and identity	Required fields exist; missing fields and empty filenames get an explicit review path. Correlate by tenant, user and session, not session alone across tenants.
Data-level replay	Store the exact candidate text, query hash, time range, run ID, full output and expected/observed counts. A changed query gets a new version.
Benign and failure controls	Test authorized multi-document work, repeated reads, absent source metadata, filename collision, delayed arrival and session lookback truncation.
Scheduling	Measure ingestion delay; set lookback and frequency; avoid duplicate incidents across overlapping windows. Test with event replay.
Entity and alert output	Retain user, tenant, session and event time. Verify entity mappings against returned columns and capture a generated test alert.
Operations	Assign an owner, triage steps, suppression rules, rollback and a monitored baseline period. No automated containment is enabled by this report.

10 / CONDITION TIME IS NOT ALERT TIME

Could defenders have acted in time?

The first external-link response is recorded at 10:43:08.000. Four candidate conditions exist before it. These are event-time leads calculated from the sequence, not measured alert-delivery times.

Figure 4. Seconds from the first satisfied condition to the first recorded external-link response. D3 uses the captured keyword predicate, D9 the time-aware B logic, D1 its fixed-bin threshold, and D4 the configuration read. S019, S028, S032, S033, S104.

CONDITION	TIME UTC	LEAD
D3 first matching search	10:42:41.000	27 s
D9 first off-source read	10:42:47.000	21 s
D1 fifth read in bin	10:42:55.000	13 s

CONDITION	TIME UTC	LEAD
D4 configuration read	10:42:55.000	13 s
D2/D8 response predicate	10:43:08.000	0 s

A five-minute schedule offers no dependable chance to act inside a 13-27 second lead. An alert might arrive sooner if a run aligns with the event, but ingestion, query execution, delivery and response time can consume the interval. The dataset has no measurements for those delays. A prevention claim would require a tested inline control or a measured streaming path, plus evidence that it blocks the relevant output.

What to deploy first

Start observation with D1 and the replay-backed D9-B as complementary review signals, then D2 for external-link staging. Retain D3 and D4 as context, D8 as a secondary predicate, and D5 as a logging-quality check. D9-C now has a captured scoped replay and synthetic controls. Use D7-R for corroboration, not attack paging; its revised access-to-prompt purpose differs from the original unexecuted attachment-to-session design. No-source reads below D1's threshold remain a gap unless the review path is implemented.

11 / CONTEXT IS NOT INCIDENT PROOF

Threat intelligence and technique mapping

The hunt is named EchoLeak in the supplied scenario. The notes also use CoSnitch and SearchLeak and give CVE labels. This report does not establish that a named real-world CVE was exploited. Public research provides a mechanism to test, not evidence of the payload, actor or vulnerable product version in this range.

Microsoft describes indirect injection as instructions carried in external material consumed by an AI system, and maps the class to AML.T0051.001. Its guidance also identifies AML.T0056 for system-prompt extraction. These concepts fit the investigated sequence, with the evidence limits below. [R1]

MAPPING	PROCEDURE / STATUS	EVIDENCE
T1566.001 | Spearphishing attachment	External attachment delivery is recorded; malicious purpose is assessed from the sequence.	F1 / S018
T1204.002 | Contextual analogy	Open is recorded. OS code execution is not evidenced; the AI execution mapping is better represented by AML.T0051.001.	F1 / S018
AML.T0051.001 | Indirect prompt injection	High-confidence causal assessment, not a recovered payload.	F2-F4 / S087, S019, S022
T1083 | File and directory discovery	Sensitive-keyword file searches recorded.	F3 / S032
T1213.002 | SharePoint collection	Thirteen file reads and corroborating repository paths.	F3/F6 / S077, S085, S086
AML.T0056 | Extract LLM system prompt	System-prompt text disclosed into a response; attacker receipt unverified.	F5 / S061

MAPPING	PROCEDURE / STATUS	EVIDENCE
External-link exfiltration attempt	URL staging recorded. No completed-exfiltration technique claimed as observed.	F4 / S022, S099

Mappings not claimed as observed

T1059 requires command or scripting-interpreter behavior; Graph tool names do not establish it. T1082 concerns system information discovery and is not used here as a substitute for LLM system-prompt disclosure. T1041 requires an established C2 channel, absent from these records. T1567 describes use of an existing legitimate external web service; that property and completed transmission are not established for this host. [R2-R5, R9-R12]

The hunt follows the template's hypothesis, scope, execution, findings, detection and handover coverage. PEAK's Prepare, Execute and Act phases guide the sequence: establish the data, challenge the hypothesis, then turn findings into tested detections and assigned actions. [R6]

12 / WHAT TO FIX AND WHY

Gaps ranked by defensive value

The first priority targets the earliest preventable step: an untrusted document reaching unrelated tools and files. External-fetch visibility resolves exposure after staging. Baselines and source provenance improve detection decisions; identity, document preservation and response records support investigation and recovery. Rank reflects both interruption value and the decisions missing evidence prevents.

PRIORITY / GAP	WHY IT MATTERS	FIX / OWNER
1 | Untrusted content reaches broad tools	The observed task expanded from one document to unrelated files.	Test permission boundaries and retrieval scope; isolate untrusted content from tool authorization. AI platform owner.
2 | External-content fetch visibility	The report cannot resolve whether generated links were fetched.	Collect relevant client, proxy, resolver and service telemetry; test where fetches originate. Network / M365.
3 | No benign multi-document baseline	Zero false matches on this run says little about legitimate research agents.	Run authorized multi-document tasks and label outcomes before paging on D1/D9. Detection engineering.
4 | Missing-source and filename ambiguity	No-source low-volume reads and same-name files can evade mismatch logic.	Retain source provenance, stable file identifiers and reason-coded review. AI telemetry owner.
5 | Cross-stream request identity absent	A 2:1 access/read discrepancy has more than one explanation.	Add application/request correlation and measure ingestion delay. Logging owner.
6 | Sparse identity evidence	Successful sign-ins do not exclude token misuse.	Obtain fuller sign-in, device, token and configuration-change records. Identity team.

PRIORITY / GAP	WHY IT MATTERS	FIX / OWNER
7 | No document forensic artifact	The injected instructions and exact delivery mechanism cannot be reconstructed.	Preserve bytes, metadata and hash before quarantine. IR lead.
8 | No verified response action	A quiet audit interval does not establish removal or control effectiveness.	Record action time, scope, test result and owner sign-off. Incident commander.

13 / RECOMMENDATIONS, NOT COMPLETED ACTIONS

Handover that preserves the evidence

Unauthorized collection and response-link staging warrant incident response in this scenario. No actual handover recipient, acceptance time, containment action or removal receipt was supplied. Assign and record them; do not invent a completed handover.

DO THIS	IN PLACE OF	WHY / COMPLETION CHECK
Preserve then quarantine the document. Owner: IR.	Deleting the sole copy before analysis.	Acquire bytes and hash, preserve metadata, search reachable repositories by identity/content, and record quarantine scope and exceptions.
Restrict the host and investigate past fetches. Owner: Network / M365.	Blocking it and declaring delivery disproved.	Verify the effective block in the affected client/service path. Retrieve interval logs or record their absence; historical delivery may remain unresolved.
Assess all thirteen files. Owner: data protection and file owners.	Waiting for proof that file contents left.	Record owner, actual contents, classification, business impact and response decision for each file.
Review permissions and workflow controls. Owner: AI platform.	Treating a printed Global Reader string as proof of entitlement.	Export actual grants/configuration and test an off-source request in a safe control scenario.
Treat disclosed instructions as known; enforce controls outside them. Owner: AI platform.	Relying on a secret replacement prompt.	Review the exposed text for secrets. Rotate actual secrets if present; verify tool and data boundaries independent of prompt secrecy.
Investigate identity evidence as needed. Owner: identity team.	Assuming either a password reset alone or no identity action resolves the case.	Review full sign-in/token evidence and choose containment based on findings. Document the decision.
Preserve audit records and expand the hunt. Owner: SOC.	Assuming one observed session bounds the whole tenant.	Retain the run, obtain wider time/mailbox coverage, and document exclusions and new matches.

Responder indicators

TYPE	VALUE / USE
Sender	quarterly.reports@globalfinancereview[.]net
Document	Q3-2026-Global-Markets-Review.docx; search hint, not a unique identity
External host	metrics-cdn[.]analyticshub[.]io; response-link destination, not confirmed network contact
Session	cp-emily-20261007-1042
Payload pattern	Image URLs with base64 d= values and s= batch markers; names and a configuration label
Preservation window	20 September 2026, at least 09:15-10:47 UTC, plus earlier context and later activity

14 / FOLLOW-UP HUNTS

Next questions worth answering

LEAD	EVIDENCE NEEDED	DECISION IT ENABLES
Was any URL fetched?	Client/service/proxy logs and destination-side evidence where available	Resolve external transmission.
What did the document contain?	Preserved document bytes and metadata	Recover and test the payload without treating scenario text as forensic proof.
Did the identity have these permissions?	SharePoint/Graph grants and application context	Separate data authorization from task authorization.
What caused the extra configuration access?	Request/application IDs, read/access event exports	Resolve missing audit versus independent access.
Do benign research tasks match D1/D9?	Authorized multi-document sessions with known task scope	Tune usable detections.
Does the pattern extend beyond this run?	More days, mailboxes and response-link telemetry	Bound affected scope.
Why are Connor’s sign-ins paired?	Full token, device, correlation and ingestion fields	Separate replay from duplication or logging artifact.

Outcome

The hunt supports a high-confidence indirect prompt-injection assessment and records thirteen file reads plus external-link staging. It does not establish delivered file contents, the exact injected text, actual configuration enforcement, or verified containment. The defensive output includes replay-backed queries, failure evidence, explicit candidate versions, and a plan to close those gaps.

COPYABLE TEXT / VERSIONED VALIDATION

Appendix A | Full query library

Run each block as a separate query. A canonical text copy of this library is also embedded as a PDF attachment, within this same report. Use “Set in query” for the dated replays. No code here fetches the external URLs. Capture IDs point to prior executions; this edition transcribes or reconstructs their logic and does not claim a new workspace run. Candidate edits and their expected outputs are identified below.

Each query has a SHA-256 text fingerprint to distinguish this printed version from the execution capture. Whitespace and projection changes can alter the fingerprint without changing the predicate. The original screenshot remains the record of what was run. If a reconstructed query produces a different result, preserve that output and resolve the difference before deployment.

ID	PURPOSE	EVIDENCE
Q01	Dataset and temporal scope	S054, S072
Q02	Document receipt and open	S018, S071
Q03	Prompt and declared source	S087
Q04	Complete tool sequence and intervals	S019, S021
Q05	Files and audit labels	S024, S077
Q06	Decode response URL payloads	S022
Q07	Session baseline	S029, S073
Q08	Emily session baseline	S026
Q09	Identity context	S027, S079
Q10	Post-event activity control	S093
Q11	Prompt-source coverage	S069
Q12	Benign multi-document control	S070
Q13	Access reconciliation, including matches	S049, S085, S086
D1	Distinct files per five-minute bin	S028
D3	Sensitive-keyword search predicate	S032
D4	Configuration read or system-prompt text	S033
D5	Cross-stream mismatch, corrected form	S034, S036

ID	PURPOSE	EVIDENCE
D6	External attachment before a read sequence	S035
D8-check	Long-token predicate, captured aggregate	S067
D2	Exact external-host response predicate	S099
D9-A	Session-wide declared-file comparison	S096-S098
D9-B	Time-aware declared-file comparison	S104-S106
Q14	Session-level source coverage	S102
Q15	Read-event source coverage	S103
D9-C	Reason-classified candidate	S110-S112
T-C	Legacy five-case design, superseded by T-C6	No captured execution of this five-case fixture
T-D2	Three-case exact-host fixture	S108
T-D1	Fixed versus rolling window fixture	S109
D8-rows	Long-token response rows	S127
D7-R	Recorded-path access-to-prompt correlation	S140-S141
T-C6	D9-C six-case synthetic fixture	S115-S116
T-D4	D4 benign twins	S117
T-D1-benign	D1 volume and repeated-read controls	S125-S126
T-D6	D6 unrelated-mail control	S128-S129
T-D7	D7-R join boundaries	S142-S143
D10	Collection plus external-link response	S144-S145
T-D10	Eleven correlation controls	S146-S149

D7 lineage: revised correlation, narrower claim

The original attachment-to-session D7 remains an unexecuted design: no shared attachment hash or immutable document ID is evidenced. D7-R is a separate, executed correlation using tenant, user, exact recorded path and access-before-prompt within five minutes. It returns two pairs and has six synthetic boundary checks. It does not prove attachment contents or malicious intent. [S133-S143]

APPENDIX A / Q01

Dataset and temporal scope

Status: Reconstruction of captured inventory pivots. **Evidence:** S054, S072.

Result / expectation: 218 Copilot, 530 Office, 80 Entra rows, all on 20 September.

Use and limitations: This checks these three tables. It is not proof that every possible sensor exists or was searched.

Query SHA-256: 491ebfb53d636f4fc2955789abb9690a9c69bb5b77b0a7547c60427e82ec9124

```
union withsource=SourceTable CopilotAudit_CL,
    OfficeActivity_CL, EntraSignIn_CL
| where TimeGenerated between
    (datetime(2026-08-01) .. datetime(2026-10-18))
| where RunId == "el--17-20260920"
| summarize Rows=count(), First=min(TimeGenerated),
    Last=max(TimeGenerated)
    by SourceTable, Day=bin(TimeGenerated, 1d)
| order by Day asc, SourceTable asc
```

APPENDIX A / Q02

Document receipt and open

Status: Reconstructed pivot; containment search expanded to contains. **Evidence:** S018, S071.

Result / expectation: Receipt 09:15:22, open 10:42:08; no later named-document event in the captured search.

Use and limitations: The expanded substring version has not been replayed here. File IDs and hashes are needed to find renamed copies.

Query SHA-256: b6df20a347640c5109654c3835e8b973288b8ab9cd3a464105a40a7b03739030

```
OfficeActivity_CL
| where TimeGenerated between (datetime(2026-09-20) .. datetime(2026-09-21))
| where RunId == "el--17-20260920"

    or AttachmentNames contains "Global-Markets-Review"
| project TimeGenerated, UserId, Operation, SenderAddress,
    OfficeObjectId, AttachmentNames
| order by TimeGenerated asc
```

APPENDIX A / Q03

Prompt and declared source

Status: Captured logic with explicit replay scope. **Evidence:** S087.

Result / expectation: One prompt at 10:42:35 naming the quarterly report.

Use and limitations: The original capture uses the portal time range. The text here pins the run and date; no new execution is claimed.

Query SHA-256: 51248b1477ca61ece9a02dba20c85207f2fe557437f8b7667f19a451ef10786e

```
CopilotAudit_CL
| where TimeGenerated between (datetime(2026-09-20) .. datetime(2026-09-21))
| where RunId == "el--17-20260920"
| where SessionId == "cp-emily-20261007-1042"
| where InteractionType == "Prompt"
| project TimeGenerated, UserId, Application,
    UserPrompt, DataSourcesAccessed
```

APPENDIX A / Q04

Complete tool sequence and intervals

Status: Captured logic, layout normalized. **Evidence:** S019, S021.

Result / expectation: 21 nonempty tool-name rows: 8 searches and 13 reads.

Use and limitations: Do not filter just InteractionType=ToolCall: five search rows use Search. prev() compares the ordered rows returned by this query.

Query SHA-256: 07baba3ba3a17088efa1607da06f94896cf4b3a801627ff4b428336b5df65003

```

| where ToolName == "Graph.ReadFile"
| extend FileName = tostring(parse_json(ToolParameters).fileName)
| project TimeGenerated, FileName, SensitivityLabels
| order by TimeGenerated asc
```

APPENDIX A / Q06

Decode response URL payloads

Status: Captured logic, layout normalized. **Evidence:** S022.

Result / expectation: 3 rows with 4, 1 and 8 URLs; 12 filename payloads and one label.

Use and limitations: Decode strings as data. Do not fetch the URLs. The regex covers the parenthesized URL form in these responses, not all possible HTML/Markdown encodings.

Query SHA-256: 8b15e03156997895108d34c00293c02619ea8af787510682772b73e70d5946ec

| where TimeGenerated between (datetime(2026-09-20) .. datetime(2026-09-21))
| where RunId == "el--17-20260920"
| summarize ReadsInSession=countif(ToolName == "Graph.ReadFile")
    by SessionId
| summarize Sessions=count() by ReadsInSession
| order by ReadsInSession asc
```

APPENDIX A / Q08

Emily session baseline

Status: Captured logic, layout normalized. **Evidence:** S026.

Result / expectation: 25 sessions: one with tool rows and 24 without.

Use and limitations: Counts sessions, not rows. It does not establish one prompt and one reply per session.

Query SHA-256: 7527f2f4f616be17e05143f910bc51eda2e88857dc6243d60733a1439f730d87

```
CopilotAudit_CL
| where TimeGenerated between (datetime(2026-09-20) .. datetime(2026-09-21))
| where RunId == "el--17-20260920"
| where UserId =~ "emily.chen@cormorantcapital.com"
| summarize ToolRows=countif(isnotempty(ToolName)) by SessionId
| summarize Sessions=count(), WithToolCalls=countif(ToolRows > 0),
    ZeroToolCalls=countif(ToolRows == 0)
```

APPENDIX A / Q09

Identity context

Status: Captured logic, replay scope explicit. **Evidence:** S027, S079.

Result / expectation: Two successful Emily sign-ins from 203.0.113.45 before the event.

Use and limitations: These fields do not establish token provenance or exclude session misuse. MFA details require the corresponding record fields.

Query SHA-256: 9e37bc873783ebdded9330dc8aa0c272b53a126be238dbc3afcbef9e34f2ad23

```
EntraSignIn_CL
| where TimeGenerated between (datetime(2026-09-20) .. datetime(2026-09-21))
| where RunId == "el--17-20260920"
| where UserPrincipalName =~ "emily.chen@cormorantcapital.com"
| project TimeGenerated, IPAddress, Location, Status,
    ConditionalAccessStatus, AppDisplayName
| order by TimeGenerated asc
```

APPENDIX A / Q10

Post-event activity control

Status: Captured logic, layout normalized. **Evidence:** S093.

Result / expectation: After 10:47: 25 Copilot rows, zero tool rows; 24 Office rows.

Use and limitations: Later positive rows show the query still observes the identity. The lack of tool rows remains bounded by the run's coverage.

Query SHA-256: b760501cf7b48385040791bc6b519a29e34ac8ef806967ec792b7ce989efd4e8

```
union withsource=T CopilotAudit_CL, OfficeActivity_CL
| where TimeGenerated between (datetime(2026-09-20) .. datetime(2026-09-21))
| where RunId == "el--17-20260920"
| where UserId =~ "emily.chen@cormorantcapital.com"
| extend IsAfter1047 = TimeGenerated > datetime(2026-09-20T10:47:00Z)
| extend IsToolRow = isnotempty(column_ifexists("ToolName", ""))
| summarize Rows=count(), ToolRows=countif(IsToolRow)
    by T, IsAfter1047
```

APPENDIX A / Q11

Prompt-source coverage

Status: Captured logic, layout normalized. **Evidence:** S069.

Result / expectation: 26 prompts with a source, 62 without.

Use and limitations: This captured predicate does not trim whitespace. Session and read-event checks below use their own criteria; no universal coverage percentage is claimed.

Query SHA-256: ae028136b828dffbb9f45fdfe2f68da1edcb360f7a90fb86da90d7944874f5a0

```
CopilotAudit_CL
| where TimeGenerated between (datetime(2026-09-20) .. datetime(2026-09-21))
| where RunId == "el--17-20260920"
| where InteractionType == "Prompt"
| extend HasSources = isnotempty(tostring(DataSourcesAccessed))
| summarize Prompts=count() by HasSources
```

APPENDIX A / Q12

Benign multi-document control

Status: Captured logic, layout normalized. **Evidence:** S070.

Result / expectation: No rows outside the suspect session.

Use and limitations: No rows means the benchmark lacks this benign control, not that a multi-file session is malicious.

Query SHA-256: e9b3633fef2bc02dfae149b66d5508e4af52769d61148a728499fcdb5345005a

| summarize DistinctFiles=dcount(FileId) by SessionId
| where DistinctFiles >= 2
    and SessionId != "cp-emily-20261007-1042"
```

APPENDIX A / Q13

Access reconciliation, including matches

Status: Reconstruction preserving captured full-URL identity join. **Evidence:** S049, S085, S086.

Result / expectation: Twelve 1:1 matches and one 2:1 configuration mismatch.

Use and limitations: The path and identity join corroborates counts. It is not an event-level causal join. Manual accesses by the same user can also contribute.

Query SHA-256: c9cda48b6b17178d5abe871820de8e202fa376a23a747daf525ca49eb82e7cb4

```

| project UserId, FileId, Accesses, Reads,
    Match=iff(Accesses == Reads, "match", "mismatch")
| order by Match desc, FileId asc
```

APPENDIX A / D1

Distinct files per five-minute bin

Status: Captured detector, layout normalized. **Evidence:** S028.

Result / expectation: Two rows: 5 and 8 files in the suspect session.

Use and limitations: Goal: surface concentrated collection. Mapping: T1213.002. Benign: research agents. Misses: low volume, empty IDs and bin splits. S109 demonstrates the bin split. Sites assumes this URL path schema.

Query SHA-256: 95ecc70aaca698a66df84fe185fa586eecca014b847c1547c7b5becb09d02f27

```
CopilotAudit_CL

    by UserId, SessionId, Window=bin(TimeGenerated, 5m)
| where DistinctFiles >= 5
```

APPENDIX A / D3

Sensitive-keyword search predicate

Status: Captured detector; no prompt-exclusion join. **Evidence:** S032.

Result / expectation: 8 searches, one suspect session.

Use and limitations: Goal: review sensitive discovery. Mapping: T1083. Benign: HR, legal, finance research. The earlier report added a prompt-exclusion join absent from this capture. Treat that enhancement as untested; a later prompt must not suppress an earlier unauthorized search.

Query SHA-256: 71dc92decfe8a24ec70abb201272665f0a9033d07e9fcf7c1e6d98bb2d4ebe3a

```

    ("confidential", "restricted", "salary", "acquisition", "board")
| summarize Searches=count(),
    Queries=make_set(tostring(parse_json(ToolParameters).query))
    by UserId, SessionId
```

APPENDIX A / D4

Configuration read or system-prompt text

Status: Captured detector, layout normalized. **Evidence:** S033.

Result / expectation: 2 rows: read at 10:42:55 and response at 10:44:19.002.

Use and limitations: Goal: find configuration access/disclosure. Mapping: AML.T0056 for the response. Benign: authorized administration and quoted examples. Literal-name/key changes evade this predicate; it is not a generic system-prompt detector.

Query SHA-256: 6e7ea7ca05ad070b75b9914c42ed2c25b18b8a6877ae044c7e7e28af5e81c9c8

```

    and ToolParameters has "Copilot System Configuration")
    or (InteractionType == "Response"
    and CopilotResponse has "system_prompt")
| project TimeGenerated, UserId, SessionId, InteractionType, ToolName
```

APPENDIX A / D5

Cross-stream mismatch, corrected form

Status: Captured corrected query; first-cut result retained in evidence. **Evidence:** S034, S036.

Result / expectation: 1 configuration mismatch after excluding identities without Copilot reads.

Use and limitations: Goal: logging reconciliation, no adversary mapping. First cut omitted leftsemi and returned 7 service-account groups plus the config group. The correction narrows scope, not proof of Copilot causality. Ingestion delay and manual reads remain benign causes.

Query SHA-256: cde3bfa9e1cfcf0a0a2f57cc0b88955b39ee8160403093f839da9a788cdff644

```

| join kind=leftsemi (CopilotReads | distinct UserId) on UserId
| join kind=leftouter CopilotReads on UserId, FileId
| extend Reads=coalesce(Reads, 0)
| where Accesses != Reads
```

APPENDIX A / D6

External attachment before a read sequence

Status: Captured correlation, layout normalized. **Evidence:** S035.

Result / expectation: One pair: 13 files; first read 01:27:25 after mail.

Use and limitations: Goal: review delivery-to-collection candidates. Mapping: T1566.001/T1213.002 context. The suffix exclusion can misclassify a look-alike sender domain. Parse and compare the complete domain in a new candidate. Also match document identity and bound the read interval; this query's count is session-wide, not a five-minute burst.

Query SHA-256: 7d0a1e609010fae8ca839709b622b4a0725e08ff27ba9b12b5ef264f52e93a77

```

| where BurstStart between (MailTime .. MailTime + 4h)
| project UserId, SenderAddress, AttachmentNames,
    MailTime, BurstStart, DistinctFiles, Gap=BurstStart-MailTime
```

APPENDIX A / D8-check

Long-token predicate, captured aggregate

Status: Captured aggregate test, not row-level alert execution. **Evidence:** S067.

Result / expectation: Emily: 29 replies, 3 matches, max 993. Others: 80 replies, 0 matches, max 169.

Use and limitations: Goal: host-independent review of encoded-looking output. Benign: IDs and signed links. The regex detects long character runs, not proven base64 or malicious content. To create a row-returning candidate, filter LongToken and project event/user/session; that variant needs its own replay.

Query SHA-256: be9b0947c109308fd00378ed05cd2f20a42c8d28d085c0c1d9a55d06b2f4edd2

```
CopilotAudit_CL

| where InteractionType == "Response"
| extend Len=strlen(CopilotResponse),
    LongToken=isnotempty(extract(@"([A-Za-z0-9+/=_-]{40,})",
    1, CopilotResponse))
| summarize Responses=count(), MaxLen=max(Len),
    WithLongToken=countif(LongToken)
    by IsEmily=(UserId =~ "emily.chen@cormorantcapital.com")
```

APPENDIX A / D2

Exact external-host response predicate

Status: Captured replay logic from companion body. **Evidence:** S099.

Result / expectation: 3 response rows, 4/1/8 URLs.

Use and limitations: Goal: external-link review. No completed-exfiltration mapping. A legitimate external link can match; an attacker using an approved host can evade. Regex covers the observed parenthesized URL form. Confirm required URL parsing and host normalization on the destination schema.

Query SHA-256: eea3d4b83176927ac7d1dcd39db4e5750afb83a5cf6eadf421b9763ebe9fce0a

```
let allowed = dynamic(["cormorantcapital.sharepoint.com"]);
CopilotAudit_CL
| where TimeGenerated between (datetime(2026-09-20) .. datetime(2026-09-21))
| where RunId == "el--17-20260920"
| where InteractionType == "Response"
| extend Url = extract_all(@"\((https?://[^)\s]+)\)", CopilotResponse)
| mv-expand Url to typeof(string)
| extend Host = tolower(tostring(parse_url(Url).Host))
| where isnotempty(Host) and Host !in (allowed)
| summarize Urls = count(), Hosts = make_set(Host) by UserId, SessionId, TimeGenerated
```

APPENDIX A / D9-A

Session-wide declared-file comparison

Status: Replay body supported by supplied captures. **Evidence:** S096-S098.

Result / expectation: 13 reads outside the declared quarterly-report filename.

Use and limitations: This version can allow an earlier read when a later prompt names that file. It excludes no-source sessions and cannot distinguish same-name files in different folders. These limits are demonstrated in S107.

Query SHA-256: b651cb042c474bd37aee12ef3d6779958ac0b35a6f21a29ab4c11d8e68c69e61

| join kind=inner Declared on TenantId, UserId, SessionId
| where not(set_has_element(DeclaredFiles, ReadFile))
| project TimeGenerated, SessionId, ReadFile, DeclaredFiles
```

APPENDIX A / D9-B

Time-aware declared-file comparison

Status: Replay body supported by supplied captures. **Evidence:** S104-S106.

Result / expectation: 13 reads; preceding source is the quarterly report for each.

Use and limitations: Sources after the read do not excuse it. Filename collisions remain. A no-source read can match this query, so review source context before classifying it as an attack. Scope lookback must include the source prompt.

Query SHA-256: 95f7361c874c4df4fbb7dc80e43d8281d7c82a69b2cd90aa7b1de67696c61378

```
let win = CopilotAudit_CL
  | where TimeGenerated between (datetime(2026-09-20) .. datetime(2026-09-21))

    by TenantId, UserId, SessionId, ReadTime, ReadFile
| where not(set_has_element(DeclaredBefore, ReadFile))
| project ReadTime, SessionId, ReadFile, DeclaredBefore
| sort by ReadTime asc
```

APPENDIX A / Q14

Session-level source coverage

Status: Replay body supported by supplied capture. **Evidence:** S102.

Result / expectation: 105 total; 86 with prompt; 19 without; 24 with source; 1 with reads; 0 reads/no-source.

Use and limitations: SessionId grouping is adequate for this scoped run. Multi-tenant use needs TenantId and UserId throughout. Empty-source string checks are not full provenance validation.

Query SHA-256: 60dc8a6a8cd6aecf6dcaf756c05f9d5f2b335d9ab0ce6ca2ba0c96c28b9a6ede

```
let win = CopilotAudit_CL

    Sessions_with_reads          = countif(HasReads),
    Sessions_reads_no_source     = countif(HasReads and not(HasSource))
```

APPENDIX A / Q15

Read-event source coverage

Status: Replay body supported by supplied capture. **Evidence:** S103.

Result / expectation: 13 reads with a preceding source, zero without.

Use and limitations: This tests timing of a nonempty source declaration, not whether a read belongs to that source. It does not establish metadata coverage for future traffic.

Query SHA-256: 9f4a05ad361f50007bac797e8b6e7347691e656cb833b67b1dc1579253fd59c7

    Reads_with_preceding_source = countif(HasPrecedingSource),
    Reads_no_preceding_source   = countif(not(HasPrecedingSource))
```

APPENDIX A / D9-C

Reason-classified candidate

Status: Captured scoped hunt replay. **Evidence:** S110-S112.

Result / expectation: 13 distinct read rows visible across three viewports, all source_mismatch in the incident session. Total-count footer is not visible.

Use and limitations: No-source reads enter a coverage queue, not an attack verdict. Seven-row synthetic fixture is T-C6. Basename collisions remain a known miss; no production alert test is claimed.

Query SHA-256: 3adb0d5cab749e8a8ac5d35023d0c647f31eea940089b1c9899b1911bae6a838

```

| where Reason != "declared"
| project ReadTime, TenantId, UserId, SessionId, ReadName, Reason, NamesBefore
| order by ReadTime asc
```

APPENDIX A / T-C

Legacy five-case design, superseded by T-C6

Status: Synthetic expected output; not a tenant replay. **Evidence:** No captured execution of this five-case fixture.

Result / expectation: Expected Form C: no_preceding_source, declared, no_preceding_source, declared, source_mismatch.

Use and limitations: The fixture compares basename and full-path adaptations. It exercises the central matching logic with invented inputs; it is not the complete production ingestion/parser path. S107 is a different four-case executed fixture. Retained as an unexecuted historical design; use T-C6 for the executed six-case evidence.

Query SHA-256: 079306042eabcdd9b5d304db70b0ab691c098d58812cdecce535c52459c5e743

| sort by TestCase asc
```

APPENDIX A / T-D2

Three-case exact-host fixture

Status: Captured predicate test; output-column name differs in companion. **Evidence:** S108.

Result / expectation: Exact-host results: false, true, true.

Use and limitations: The suffix comparator is a simplified comparison, not a claim that the current D2 had that defect. The fixture does not test URL extraction, encoding, ports, case or trailing dots.

Query SHA-256: b929cc388a9a19fdb0f46fb3f5fea20da1a367280d9184af10446221088b4475

| project TestCase, Host, ExactAllowList_fires, SuffixOnly_fires
```

APPENDIX A / T-D1

Fixed versus rolling window fixture

Status: Captured synthetic test. **Evidence:** S109.

Result / expectation: Fixed max 3, misses threshold 5. Rolling max 5, fires.

Use and limitations: The cross join is a small-fixture demonstration, not a production-scale rolling detector. The production window implementation and scheduling need separate validation.

Query SHA-256: ec7b9eb5e0aa30ebb7fee210e44ae049f5a8740766c8393bb6dfe70b405c6b1f

```
let Reads = datatable(T:datetime, FileId:string)[
  datetime(2026-01-01T10:42:00),"f1", datetime(2026-01-01T10:43:00),"f2",

```

APPENDIX A / D8-rows

Long-token response rows

Status: Captured execution; transcript with layout normalized. **Evidence:** S127.

Result / expectation: Three visible incident-session responses: lengths 863, 785, 993.

Use and limitations: Executed row-returning predicate, distinct from the earlier aggregate. A long token can be benign; a match proves neither external receipt nor a deployed alert.

Query SHA-256: b61976fdac9915678c332725c435f1113a6a2507fdfa81f2b07cab0f7668467b

    ResponseLength, LongToken, InKnownIncidentSession
| order by TimeGenerated asc
```

APPENDIX A / D7-R

Recorded-path access-to-prompt correlation

Status: Captured execution; transcript with layout normalized. **Evidence:** S140-S141.

Result / expectation: Two pairs: incident 27 seconds; cp-emily-norm-020 139.063 seconds.

Use and limitations: Revised purpose: file access to source prompt, not email attachment to session. A matching path is not a hash or immutable identity. No attack classification; path variants, duplicate events and renamed files need further controls.

Query SHA-256: 610c8bfd0cd405e52e101ad0613312492dcce870ea6e21a4562156b4238246f7

```

APPENDIX A / T-C6

D9-C six-case synthetic fixture

Status: Captured execution; transcript with layout normalized. **Evidence:** S115-S116.

Result / expectation: Seven rows match expectations. One known filename-collision miss. Both benign multi-document reads are excluded.

Use and limitations: Synthetic data; not a real benign tenant session. Original fixture failed to parse (S113/S114); corrected transcript removes blank lines and retains ReadTime before sort. The parse-error root cause was not proven.

Query SHA-256: fb83eff35a2b0c96238479dd8daec8e46602a86f537ab2cd13a2fd5be0141f93

ORIGINAL SCREENSHOTS / ANNOTATED REGISTER

Appendix B | Captured evidence

Selected captures are reproduced from the supplied files without retouching. This upload edition omits the original-image archive to meet the portal limit. The full evidence master retains all 149 originals. Selected images below are compressed derivatives; Appendix C hashes identify the original inputs, not these derivatives. The reference register below retains every cited capture and its interpretation. Captions are analyst interpretations, separate from the images. Wider grids retain their original resolution for zooming; the report's native tables and query text carry the key values at reading size. Captures can show partial viewports, so paired views are cited where needed.

Screenshot filenames record capture time on 17-19 October. They are not event timestamps. Hunt events use UTC on 20 September; synthetic fixtures use 1 January. Neither is the screenshot capture date. The S identifiers are new to this edition and do not reuse the prior report's B numbering.

ID	CONTENT / INTERPRETATION	SUPPORTS
S018	Delivery and open. The expanded records name the sender, attachment, recipient and document path. Receipt: 09:15:22. Open: 10:42:08.	F1
S087	The user's request and source. Prompt at 10:42:35 in Word: summarize the quarterly report. DataSourcesAccessed names that document.	F2
S019	Tool sequence, first viewport. The first eight tool-name events occur at two-second intervals. Later search events use InteractionType=Search.	F3
S021	Tool sequence, later viewport. The second wave starts at 10:45:30. Its spacing varies, so the exact two-second claim applies to wave one.	F3
S022	Decoded URL payloads. Three response groups: 4, 1 and 8 URLs. The configuration payload is a label. This capture does not show a network request.	F4
S060	First response and its chart links. The response blends a market summary with image URLs. Preserve the text as evidence; do not open the URLs.	F4
S061	Configuration text in a response. The response displays system_prompt and enterprise_config. These strings are not an entitlement export.	F5
S077	Thirteen file reads and their labels. Four Confidential, one Internal Only and eight blank labels appear in the audit rows.	F3, F8
S085	Cross-stream reconciliation, later rows. Configuration: two Office accesses and one Copilot read. Other visible rows match one to one.	F6
S086	Cross-stream reconciliation, earlier rows. Companion viewport for the thirteen-file reconciliation.	F6
S073	The read-session baseline. 104 sessions have zero reads; one has thirteen.	F7
S026	Emily's session baseline. 25 sessions, one with tool calls and 24 without.	F7

ID	CONTENT / INTERPRETATION	SUPPORTS
S027	Available Emily sign-ins. Two successful same-IP sign-ins at 10:15:31.010 and 10:29:45.313. The view does not exclude token misuse.	Identity context
S071	Last recorded named-document events. The named search returns receipt and open. No removal event is shown; current presence is unverified.	F9
S093	After-10:47 positive control. 25 later Copilot rows with zero tool rows; 24 later Office rows. Activity remains visible to the query.	F9
S054	Date-range inventory. A wider date search returns the run on 20 September, with the first and last timestamps for each table.	Scope
S072	Table inventory. CopilotAudit 218, OfficeActivity 530, EntraSignIn 80.	Scope
S025	Second-clock availability. The OriginalTime check does not supply a usable alternative clock.	Scope
S069	Prompt-source population. 26 prompts with a source and 62 without. This denominator is prompts, not reads.	Coverage
S102	Session-source population. 105 sessions, 86 with prompt, 19 without, 24 with declared source, one with reads, zero reads/no-source.	Coverage
S103	Read-event source population. 13 reads have a preceding source; zero do not.	Coverage
S070	No benign multi-document control. The scoped query excludes the suspect session and returns no multi-file sessions.	Coverage
S028	D1 burst result. Two fixed bins: 8 files in 10:45 and 5 in 10:40.	D1
S099	D2 exact-host replay. Three response-level matches with 8, 1 and 4 URLs.	D2
S032	D3 keyword predicate. Eight searches in one session. The capture contains no prompt-exclusion join.	D3
S033	D4 configuration predicate. Two records: one configuration read and one system-prompt response.	D4
S034	D5 first cut and service noise. The initial mismatch query includes seven svc-compliance file groups and the configuration group.	D5 failure
S036	D5 corrected scope. Restricting to identities with Copilot reads leaves one configuration discrepancy: 2 accesses versus 1 read.	D5 correction
S035	D6 delivery-to-read pair. One pair, 13 files, 01:27:25 from mail to first read. The query does not match attachment identity to source identity.	D6
S067	D8 aggregate predicate check. Emily: 29 replies, 3 long-token matches, max 993. Other users: 80 replies, 0 matches, max 169.	D8
S096	D9-A replay. Thirteen file-name mismatches against the declared quarterly report.	D9-A

ID	CONTENT / INTERPRETATION	SUPPORTS
S104	D9-B time-aware replay, first viewport. Thirteen total rows. The preceding source is the quarterly report.	D9-B
S106	D9-B time-aware replay, last viewport. Last seven rows complete the view of the thirteen mismatches.	D9-B
S107	Legacy D9 four-case fixture. Executed session-basename versus time-aware/full-path test. This is not the five-case Form C reason-label suite.	Boundary testing
S108	D2 three-host fixture. Exact allow-list: false, true, true. The simplified suffix predicate gives true, false, true.	Boundary testing
S109	D1 bin-split fixture. Fixed-bin maximum 3; rolling maximum 5. Threshold 5 misses in fixed bins.	Boundary testing
S094	Historical query with the wrong picker range. The no-results message says “last 24 hours.” This is not a negative finding for the hunt date.	Dead end
S101	Coverage query parse failure. The failed query is preserved. S102 shows the corrected execution.	Dead end
S088	Post-event query parse failure. The failed query is preserved. S093 shows the corrected execution.	Dead end
S050	Schema substring correction. The schema search follows the earlier has-based empty result.	Method
S039	Separate identity lead. Paired Connor sign-in rows require deeper token/device evidence; they are not attributed to this incident.	Next hunt
S091	Separate identity lead, IP viewport. Two IPs accompany paired rows. The capture does not resolve duplication versus misuse.	Next hunt
S013	Image markup in the baseline. Image markup appears outside the suspect session. Markup alone is not enough to classify a response.	Alternative
S043	Emily has a later benign chart response. The query includes the three incident replies and a later chart session. Context and host matter.	Alternative
S110	D9-C replay: first five reads. All five visible rows are source_mismatch. S111-S112 complete the thirteen distinct incident reads; no total-count footer is visible.	D9-C
S111	D9-C replay: middle viewport. Five later reads, including overlap with S112. Count distinct events rather than adding viewport rows.	D9-C
S112	D9-C replay: final viewport. Final five reads; two overlap S111. All show the declared quarterly report.	D9-C
S113	D9-C fixture: first parse failure. Comma parse error. This is not a zero-result test.	Fixture failure
S114	D9-C fixture: repeated failure. Second error capture; same outcome, not an additional boundary case.	Fixture failure
S115	D9-C corrected fixture inputs. Corrected input transcript; S116 supplies all seven results.	T-C6

ID	CONTENT / INTERPRETATION	SUPPORTS
S116	D9-C corrected fixture results. Seven expected outcomes, including two declared multi-document reads and one known filename-collision miss.	T-C6
S117	D4 benign twins. Four matches: two incident-like and two benign. The normal summary does not match.	T-D4
S126	D1 threshold component controls. Authorized five-file task matches; four files and repeated reads of one file do not.	T-D1-benign
S127	D8 response-row replay. Three responses, lengths 863/785/993, all in the incident session.	D8-rows
S128	D6 unrelated-mail match. Expanded row: unrelated newsletter plus authorized reads, gap 01:00:10. GroundTruth and boolean labels are test constants.	T-D6
S129	D6 synthetic input transcript. Mail and read input rows for the unrelated-mail test.	T-D6
S133	Schema: Copilot fields. No shared document GUID appears as a top-level field in the shown schema. Nested content requires inspection.	D7 prerequisites
S134	Schema: source and Office fields. DataSourcesAccessed and ToolParameters are strings; Office offers attachment names and object references.	D7 prerequisites
S135	Schema: remaining Office fields. OfficeObjectId, SiteUrl and SourceFileName support reference inspection; no attachment hash is shown.	D7 prerequisites
S136	Receipt and file-access reference. Receipt names an attachment; file access at 10:42:08 records the personal document path.	F1 / D7-R
S137	Prompt shares the recorded path. The 10:42:35 prompt carries the same tenant, user and path as the file access 27 seconds before it.	F2 / D7-R
S138	Reference reconciliation: sixteen rows. Footer shows 16 total rows: receipt, access, prompt and thirteen reads.	D7 prerequisites
S141	D7-R replay: two expanded pairs. Incident gap 27 s; cp-emily-norm-020 gap 139.063 s. Matching paths are not proof of matching bytes or malicious intent.	D7-R
S140	D7-R replay: query and results. Exact recorded-path join across the run returns two visible pairs.	D7-R
S142	D7-R boundary results. Six expected outcomes: valid pair accepted; five invalid pairs excluded.	T-D7
S143	D7-R synthetic inputs. Inputs distinguish folder, user, tenant, ordering and time-window failures.	T-D7
S144	D10 hunt replay result. One visible incident session, three response times, maximum 13 file IDs and metrics-cdn.analyticshub.io. No total-count footer is visible.	D10
S145	D10 correlation logic. Read and response join on tenant, user and session, with a rolling five-minute lookback.	D10
S146	D10 eleven-case results. All eleven outcomes agree with expectation. T10 is an expected benign match.	T-D10

ID	CONTENT / INTERPRETATION	SUPPORTS
S147	D10 fixture inputs. Eleven cases and constructed read/response rows.	T-D10
S148	D10 fixture correlation. Correlation function and fixture schema.	T-D10
S149	D10 fixture function. Function start and join/time/count logic.	T-D10

S019 | Tool sequence, first viewport. The first eight tool-name events occur at two-second intervals. Later search events use InteractionType=Search. Original image: S019/Screenshot 2026-10-17 at 4.51.16 PM.png in the full evidence master.

S021 | Tool sequence, later viewport. The second wave starts at 10:45:30. Its spacing varies, so the exact two-second claim applies to wave one. Original image: S021/Screenshot 2026-10-17 at 4.51.38 PM.png in the full evidence master.

S060 | First response and its chart links. The response blends a market summary with image URLs. Preserve the text as evidence; do not open the URLs. Original image: S060/Screenshot 2026-10-17 at 6.32.21 PM.png in the full evidence master.

S061 | Configuration text in a response. The response displays system_prompt and enterprise_config. These strings are not an entitlement export. Original image: S061/Screenshot 2026-10-17 at 6.32.51 PM.png in the full evidence master.

S085 | Cross-stream reconciliation, later rows. Configuration: two Office accesses and one Copilot read. Other visible rows match one to one. Original image: S085/Screenshot 2026-10-18 at 4.19.36 PM.png in the full evidence master.

S086 | Cross-stream reconciliation, earlier rows. Companion viewport for the thirteen-file reconciliation. Original image: S086/Screenshot 2026-10-18 at 4.19.48 PM.png in the full evidence master.

S073 | The read-session baseline. 104 sessions have zero reads; one has thirteen. Original image: S073/Screenshot 2026-10-18 at 4.09.25 PM.png in the full evidence master.

S026 | Emily's session baseline. 25 sessions, one with tool calls and 24 without. Original image: S026/Screenshot 2026-10-17 at 4.55.41 PM.png in the full evidence master.

S027 | Available Emily sign-ins. Two successful same-IP sign-ins at 10:15:31.010 and 10:29:45.313. The view does not exclude token misuse. Original image: S027/Screenshot 2026-10-17 at 4.56.19 PM.png in the full evidence master.

S071 | Last recorded named-document events. The named search returns receipt and open. No removal event is shown; current presence is unverified. Original image: S071/Screenshot 2026-10-17 at 8.20.45 PM.png in the full evidence master.

S093 | After-10:47 positive control. 25 later Copilot rows with zero tool rows; 24 later Office rows. Activity remains visible to the query. Original image: S093/Screenshot 2026-10-18 at 4.29.39 PM.png in the full evidence master.

S054 | Date-range inventory. A wider date search returns the run on 20 September, with the first and last timestamps for each table. Original image: S054/Screenshot 2026-10-17 at 6.27.20 PM.png in the full evidence master.

S072 | Table inventory. CopilotAudit 218, OfficeActivity 530, EntraSignIn 80. Original image: S072/Screenshot 2026-10-18 at 4.08.14 PM.png in the full evidence master.

S025 | Second-clock availability. The OriginalTime check does not supply a usable alternative clock. Original image: S025/Screenshot 2026-10-17 at 4.54.57 PM.png in the full evidence master.

S069 | Prompt-source population. 26 prompts with a source and 62 without. This denominator is prompts, not reads. Original image: S069/Screenshot 2026-10-17 at 8.19.47 PM.png in the full evidence master.

S102 | Session-source population. 105 sessions, 86 with prompt, 19 without, 24 with declared source, one with reads, zero reads/no-source. Original image: S102/Screenshot 2026-10-18 at 8.13.52 AM.png in the full evidence master.

S103 | Read-event source population. 13 reads have a preceding source; zero do not. Original image: S103/Screenshot 2026-10-18 at 8.14.16 AM.png in the full evidence master.

S070 | No benign multi-document control. The scoped query excludes the suspect session and returns no multi-file sessions. Original image: S070/Screenshot 2026-10-17 at 8.20.15 PM.png in the full evidence master.

S028 | D1 burst result. Two fixed bins: 8 files in 10:45 and 5 in 10:40. Original image: S028/Screenshot 2026-10-17 at 4.56.49 PM.png in the full evidence master.

S032 | D3 keyword predicate. Eight searches in one session. The capture contains no prompt-exclusion join. Original image: S032/Screenshot 2026-10-17 at 4.58.57 PM.png in the full evidence master.

S033 | D4 configuration predicate. Two records: one configuration read and one system-prompt response. Original image: S033/Screenshot 2026-10-17 at 4.59.31 PM.png in the full evidence master.

S034 | D5 first cut and service noise. The initial mismatch query includes seven svc-compliance file groups and the configuration group. Original image: S034/Screenshot 2026-10-17 at 5.00.12 PM.png in the full evidence master.

S036 | D5 corrected scope. Restricting to identities with Copilot reads leaves one configuration discrepancy: 2 accesses versus 1 read. Original image: S036/Screenshot 2026-10-17 at 5.10.31 PM.png in the full evidence master.

S035 | D6 delivery-to-read pair. One pair, 13 files, 01:27:25 from mail to first read. The query does not match attachment identity to source identity. Original image: S035/Screenshot 2026-10-17 at 5.01.13 PM.png in the full evidence master.

S067 | D8 aggregate predicate check. Emily: 29 replies, 3 long-token matches, max 993. Other users: 80 replies, 0 matches, max 169. Original image: S067/Screenshot 2026-10-17 at 6.38.47 PM.png in the full evidence master.

S106 | D9-B time-aware replay, last viewport. Last seven rows complete the view of the thirteen mismatches. Original image: S106/Screenshot 2026-10-18 at 8.25.16 AM.png in the full evidence master.

S094 | Historical query with the wrong picker range. The no-results message says “last 24 hours.” This is not a negative finding for the hunt date. Original image: S094/Screenshot 2026-10-18 at 8.00.57 AM.png in the full evidence master.

S101 | Coverage query parse failure. The failed query is preserved. S102 shows the corrected execution. Original image: S101/Screenshot 2026-10-18 at 8.11.22 AM.png in the full evidence master.

S088 | Post-event query parse failure. The failed query is preserved. S093 shows the corrected execution. Original image: S088/Screenshot 2026-10-18 at 4.22.00 PM.png in the full evidence master.

S050 | Schema substring correction. The schema search follows the earlier has-based empty result. Original image: S050/Screenshot 2026-10-17 at 5.36.08 PM.png in the full evidence master.

S039 | Separate identity lead. Paired Connor sign-in rows require deeper token/device evidence; they are not attributed to this incident. Original image: S039/Screenshot 2026-10-17 at 5.13.16 PM.png in the full evidence master.

S091 | Separate identity lead, IP viewport. Two IPs accompany paired rows. The capture does not resolve duplication versus misuse. Original image: S091/Screenshot 2026-10-18 at 4.23.40 PM.png in the full evidence master.

S013 | Image markup in the baseline. Image markup appears outside the suspect session. Markup alone is not enough to classify a response. Original image: S013/Screenshot 2026-10-17 at 4.46.54 PM.png in the full evidence master.

S043 | Emily has a later benign chart response. The query includes the three incident replies and a later chart session. Context and host matter. Original image: S043/Screenshot 2026-10-17 at 5.16.01 PM.png in the full evidence master.

S110 | D9-C replay: first five reads. All five visible rows are source_mismatch. S111-S112 complete the thirteen distinct incident reads; no total-count footer is visible. Original image: S110/Screenshot 2026-10-19 at 8.01.00 AM.png in the full evidence master.

S111 | D9-C replay: middle viewport. Five later reads, including overlap with S112. Count distinct events rather than adding viewport rows. Original image: S111/Screenshot 2026-10-19 at 8.01.18 AM.png in the full evidence master.

S112 | D9-C replay: final viewport. Final five reads; two overlap S111. All show the declared quarterly report. Original image: S112/Screenshot 2026-10-19 at 8.01.41 AM.png in the full evidence master.

S114 | D9-C fixture: repeated failure. Second error capture; same outcome, not an additional boundary case. Original image: S114/Screenshot 2026-10-19 at 8.08.04 AM.png in the full evidence master.

S115 | D9-C corrected fixture inputs. Corrected input transcript; S116 supplies all seven results. Original image: S115/Screenshot 2026-10-19 at 8.11.44 AM.png in the full evidence master.

S129 | D6 synthetic input transcript. Mail and read input rows for the unrelated-mail test. Original image: S129/Screenshot 2026-10-19 at 8.28.39 AM.png in the full evidence master.

S133 | Schema: Copilot fields. No shared document GUID appears as a top-level field in the shown schema. Nested content requires inspection. Original image: S133/Screenshot 2026-10-19 at 8.31.46 AM.png in the full evidence master.

S134 | Schema: source and Office fields. DataSourcesAccessed and ToolParameters are strings; Office offers attachment names and object references. Original image: S134/Screenshot 2026-10-19 at 8.32.11 AM.png in the full evidence master.

S135 | Schema: remaining Office fields. OfficeObjectId, SiteUrl and SourceFileName support reference inspection; no attachment hash is shown. Original image: S135/Screenshot 2026-10-19 at 8.32.33 AM.png in the full evidence master.

S136 | Receipt and file-access reference. Receipt names an attachment; file access at 10:42:08 records the personal document path. Original image: S136/Screenshot 2026-10-19 at 8.34.38 AM.png in the full evidence master.

S137 | Prompt shares the recorded path. The 10:42:35 prompt carries the same tenant, user and path as the file access 27 seconds before it. Original image: S137/Screenshot 2026-10-19 at 8.34.59 AM.png in the full evidence master.

S140 | D7-R replay: query and results. Exact recorded-path join across the run returns two visible pairs. Original image: S140/Screenshot 2026-10-19 at 8.38.22 AM.png in the full evidence master.

S143 | D7-R synthetic inputs. Inputs distinguish folder, user, tenant, ordering and time-window failures. Original image: S143/Screenshot 2026-10-19 at 8.41.45 AM.png in the full evidence master.

S145 | D10 correlation logic. Read and response join on tenant, user and session, with a rolling five-minute lookback. Original image: S145/Screenshot 2026-10-19 at 1.47.36 PM.png in the full evidence master.

S147 | D10 fixture inputs. Eleven cases and constructed read/response rows. Original image: S147/Screenshot 2026-10-19 at 1.52.20 PM.png in the full evidence master.

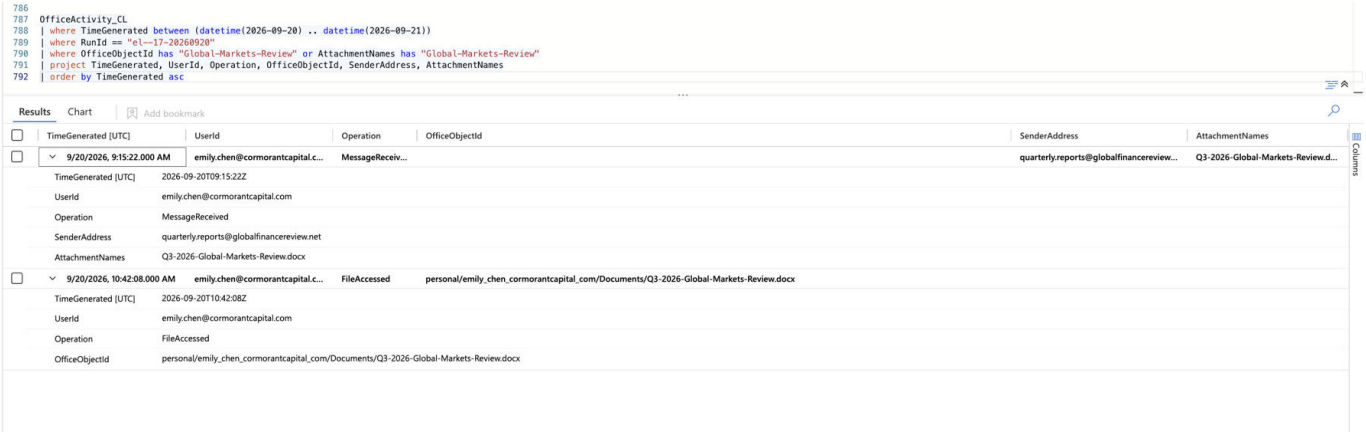

S148 | D10 fixture correlation. Correlation function and fixture schema. Original image: S148/Screenshot 2026-10-19 at 1.52.58 PM.png in the full evidence master.

S149 | D10 fixture function. Function start and join/time/count logic. Original image: S149/Screenshot 2026-10-19 at 1.53.14 PM.png in the full evidence master.

APPENDIX B / S018

Delivery and open

The expanded records name the sender, attachment, recipient and document path. Receipt: 09:15:22. Open: 10:42:08.

APPENDIX B / S104

D9-B time-aware replay, first viewport

Thirteen total rows. The preceding source is the quarterly report.

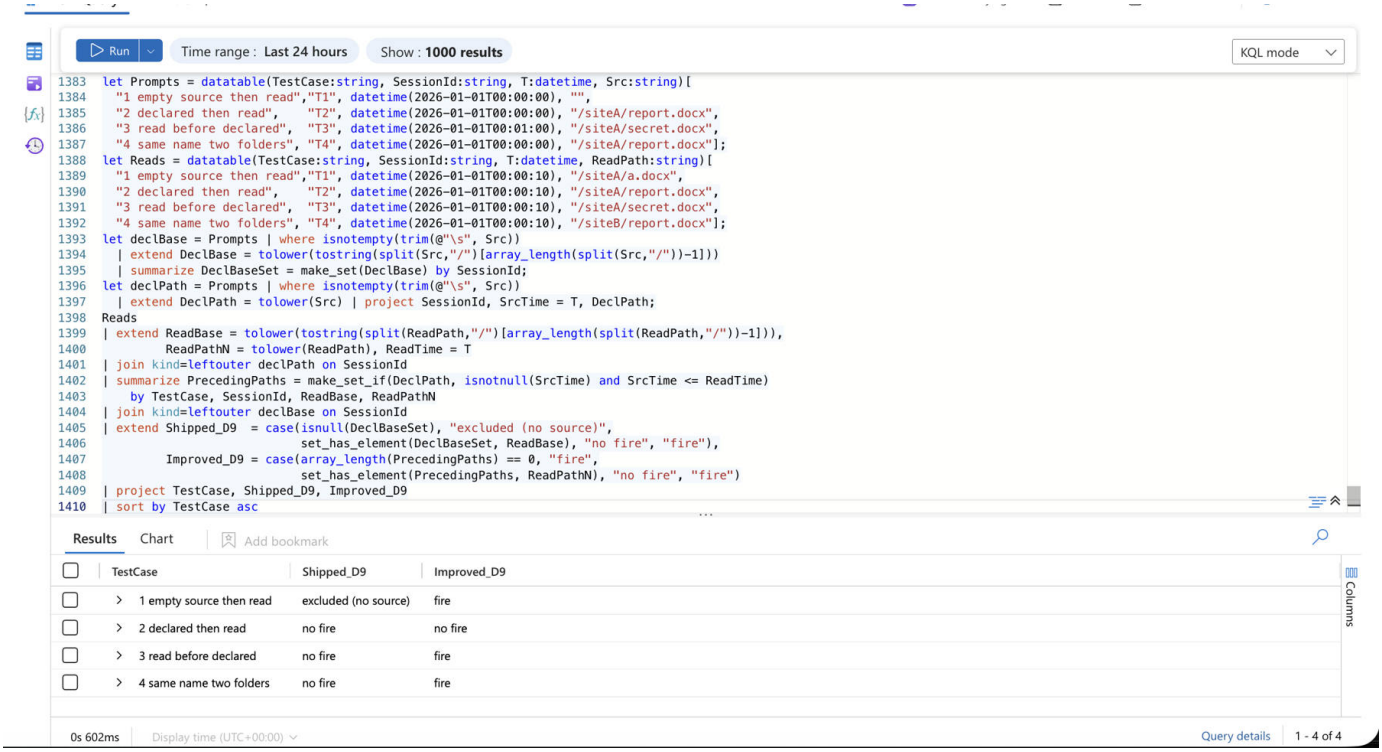

Source: Screenshot 2026-10-18 at 8.24.21 AM.png

Supports: D9-B. Original size: 2186 x 1164 pixels. SHA-256: 57e925988218ae1029edb76a9f2b882f53230bb108b1fe3169b9f02462e67463

APPENDIX B / S107

Legacy D9 four-case fixture

Executed session-basename versus time-aware/full-path test. This is not the five-case Form C reason-label suite.

Source: Screenshot 2026-10-18 at 8.26.25 AM.png

Supports: Boundary testing. Original size: 2240 x 1210 pixels. SHA-256: 856900e3462b02ef3dc5eb6edc9d0420d6d8b4640eff65a0e987a374f15dda1e

APPENDIX B / S108

D2 three-host fixture

Exact allow-list: false, true, true. The simplified suffix predicate gives true, false, true.

```
let Responses = datatable(TestCase:string, Host:string)[
  "5 approved tenant host",          "cormorantcapital.sharepoint.com",
  "6 lookalike ends in approved str", "evilcormorantcapital.com",
  "7 external beacon host",          "metrics-cdn.analyticshub.io"];
let allowExact = dynamic(["cormorantcapital.sharepoint.com"]);
Responses
| extend ExactAllowList_fires = tolower(Host) !in (allowExact),
         NaiveEndswith_fires  = not(tolower(Host) endswith "cormorantcapital.com")
| project TestCase, Host, ExactAllowList_fires, NaiveEndswith_fires
```

Results | Chart | Add bookmark

TestCase	Host	ExactAllowList_fires	NaiveEndswith_fires
5 approved tenant host	cormorantcapital.sharepoint.com	false	true
6 lookalike ends in approved str	evilcormorantcapital.com	true	false
7 external beacon host	metrics-cdn.analyticshub.io	true	true

PROVENANCE / 149 SCREENSHOTS

Appendix C | Input inventory

All supplied PNGs are inventoried below, including duplicate viewports, failed queries and two near-empty fragments. Inclusion in this inventory is not an assertion that a file proves a finding. All originals are in the full evidence master. The register identifies cited evidence; selected captures are reproduced in Appendix B. Hashes identify the input bytes; they do not authenticate the original workspace or prove completeness of a result grid.

Public references checked during preparation on 18 October 2026. They define mechanisms and query semantics; they do not corroborate this tenant’s events. No framework version number or unverified CVE attribution is used to strengthen the incident finding.

Authorship and review limits

Investigation by Jenna Frank. AI-assisted drafting, source reconciliation, query transcription and page design produced this edition from supplied materials. Local text recognition supported screenshot review; material results were checked against the source images. The author supplied new query executions on 19 October, reviewed in S110-S149. No containment action or alert deployment is evidenced. The final report preserves these limits rather than treating expected results as execution evidence.

Document control

VERSION / DATE	CHANGE
3.6 | Prior supplied edition	Source report used as the baseline for the rebuild. Its claims and query bodies were checked against supplied captures. Earlier revision dates are not asserted here.
4.0 | 18 October 2026	Rebuilt as one report with native visuals, evidence provenance, full query text and captured test failures. Distinguished captured execution from reconstructed or unexecuted logic.
4.1 | 19 October 2026	Added an evidence-linked UTC timeline, template-guided source coverage assessments and a concise revision trail.
4.2 | 19 October 2026	Integrated author-run D9-C/D8 replays, D7-R recorded-path correlation, and synthetic D1/D4/D6/D7/D9 controls. Preserved fixture failures and updated validation claims without converting synthetic results into production rates.
4.3 | 19 October 2026	Consolidated screenshot presentation into a reference register, selected facsimiles and a complete source archive in the full evidence master. Added D10 correlation with author-run hunt replay and eleven executed synthetic controls, including an expected benign match. Preserved 4.2 as the scored edition.

Submission status: report prepared for review. Remaining operational work includes candidate replay, benign multi-document testing, document preservation, external-fetch evidence and response verification. These are named gaps, not completed actions. No score is asserted by this report.
